

Shotcrete Training – Bowie, MD

February 19-21, 2014

Lupini Construction, Inc personnel made the trip to Bowie, Maryland to receive classroom and hands-on training in the application of pneumatically-placed concrete, or Shotcrete as part of our continuing education and technical training.

“Shotcrete is often the best alternative when repair and restoration are being contemplated and can be the ideal application method for both reinforced and nonreinforced construction. From tanks and pools to chemical and automotive to retaining walls and highway structures, the opportunities are endless.

The shotcrete professional must be able to integrate new materials with in-place construction to form a composite that will stand up to exposure and use. As important as the materials is the coordination of effort from a properly qualified contractor, materials supplier, engineer, and architect. When all of these pieces are in place, the exceptional benefits of the shotcrete process are realized.

[Ideal for] Bridges, Parking Garages, Dams & Reservoirs, Seismic Retrofit, Marine, Sewers.”
